**DESCRIPTION OF THE PROBLEM**  
-----

This project is created using relational database. The project was developed using MYSQL, Wamp Server, CSS, HTML and PHP.

The database was developed with following concepts :

Users can be identified by their username and password.

Other information stored for a user includes First Name, Last Name, Email-Id. and Balance.

Each user can take a book based on the balance he/she has in his/her account and availability of the book.

The user may choose book from any of the available categories as fiction , non-fiction and education.

There are various functionalities of the librarian section, namely pending registration, pending book request ,adding a new book , update copies of the book , update balance of a member etc.

Each book has a name(title), author ,category ,price and number of copies.

Each user can issue multiple books of various or same author.

Books to be returned are recorded and updated accordingly.
